Team ID	Not Assigned
Project Name	Rising Waters: A Machine Learning Approach to Flood Prediction
Maximum Marks	4 Marks

Empathy Map

Create an empathy map to understand your customer/user from four perspectives - what they Say, Think, Do, and Feel - in relation to the problem your project addresses. This helps the team build a customer-centric solution.

SAYS • "We need flood warnings at least 6 hours in advance to evacuate safely." • "Manual weather analysis is too slow — we need an automated system." • "I want to enter rainfall data and instantly know if there is a flood risk."	THINKS • If I had a reliable prediction tool, I could save hundreds of lives each monsoon season. • Current forecasting methods are outdated and cannot handle complex rainfall patterns. • A machine learning model trained on historical data would be far more accurate.
PERSONA NAME Meteorologist <i>(Disaster Management Officer / Local Authority)</i>	
DOES • Manually records daily rainfall, temperature, humidity and cloud cover readings. • Monitors weather forecasts from multiple sources during monsoon season. • Issues flood alerts based on experience and limited data — often too late.	FEELS • Anxious and underprepared when heavy rainfall begins without a reliable prediction. • Frustrated by the lack of intelligent, data-driven flood forecasting tools. • Relieved and confident when using the Rising Waters system to get instant risk assessments.
