

Customer Journey Map

Date	26/06/2026
Team ID	Not Assigned
Project Name	Rising Waters: A Machine Learning Approach to Flood Prediction
Maximum Marks	2 Marks

Customer Journey Map

Map out the customer's experience stage-by-stage, capturing their actions, touchpoints, thoughts, and feelings, along with process ownership and improvement opportunities at each stage.

Phase of Journey	Stage 1 Awareness & Data Input	Stage 2 Prediction & Processing	Stage 3 Result & Action
Actions <i>What does the customer do?</i>	- Identifies flood-prone region requiring risk assessment - Collects current meteorological readings - Opens Rising Waters web application	- Enters 10 weather parameters into the prediction form - Submits data to the Flask backend for processing - Waits for the ML model to generate a prediction	- Views flood risk result (Flood / No Flood) - Reviews flood probability percentage score - Takes action based on advisory recommendations
Touchpoint <i>What part of the service do they interact with?</i>	- Home page (home.html) — learns about the system - Navigation bar — accesses prediction form - Web browser on desktop or mobile device	- Prediction input form (index.html) — enters data - Flask backend — processes and scales inputs - XGBoost model (floods.save) — generates prediction	- Result page — chance.html or no_chance.html - Probability gauge and progress bar visual - Advisory action list on result page
Customer Thought <i>What is the customer thinking?</i>	- Is this system reliable enough for official use? - Will entering rainfall data be simple and quick? - Can this tool replace our slow manual process?	- How long will the model take to process my input? - Is the XGBoost model trained on relevant Indian data? - Will the scaler correctly normalise my entered values?	- The result is clear — I know what action to take now. 96.55% accuracy gives me confidence in this prediction. - I should run predictions for multiple regions next.
Customer Feeling <i>What is the customer feeling?</i>	- Curious about the system's capabilities - Hopeful that it will improve disaster preparedness - Slightly uncertain about data entry requirements	- Focused and attentive while entering weather values - Slightly anxious waiting for the prediction result - Trusting the system based on its accuracy claims	- Relieved when the system confirms low flood risk - Alarmed but prepared when flood risk is detected - Confident in issuing advisories based on ML output
Process Ownership <i>Who is in the lead on this?</i>	Gowthamsai Setti (UI Design & Flask Routing)	Sai Siddardha Bevara (ML Model & Scaler Integration)	Rishitha Padaga (Result Pages & Advisory Logic)
Opportunities <i>How can we improve this stage?</i>	- Add auto-location detection for region-specific inputs - Provide tooltip hints for each input field - Add sample data pre-fill button for quick testing	- Integrate live weather API for automatic data fetch - Add model confidence interval display - Enable batch prediction for multiple regions at once	- Add downloadable PDF report of prediction results - Send SMS/email alerts when flood risk is detected - Store prediction history for trend analysis
